

Java Package Practice

A beginner-friendly exercise: create package → create class → import package → use class

Goal

Create two packages:

```
com.school.students
com.school.main
```

Step 1 — Create a class inside com.school.students

Create a class called **Student**. It should have:

```
String name;
int age;
```

And a method:

```
public void displayStudent()
```

which prints:

```
Student Name: Rahul
Student Age: 21
```

Step 2 — Create another class inside com.school.main

Create a class called **Main**. Inside Main:

- 1 Import the Student class.
- 2 Create an object of Student.
- 3 Assign: name = "Rahul", age = 21
- 4 Call displayStudent().

Expected output:

```
Student Name: Rahul
Student Age: 21
```

Project Structure

Your project should look like:

```
src
  ■
  ■■■ com
```

```

    ■■■ school
      ■
      ■■■ students
      ■   ■■■ Student.java
      ■
      ■■■ main
          ■■■ Main.java
```

Important

In **Student.java**:

```
package com.school.students;
```

In **Main.java**:

```
package com.school.main;

import com.school.students.Student;
```

■ Challenge

After completing the above, modify Student to have:

```
String name;
int age;
String course;
```

Create a method:

```
displayStudent()
```

Expected output:

```
Name: Rahul
Age: 21
Course: Java
```

■ Don't look for the solution first. Try creating the folders, packages, classes, and import yourself. Then share your code to be checked line by line.
