

Employee Management System

Java Practice Task: Inheritance, Method Overriding & if-else Conditions

Task

Create the following classes:

1. Employee — Parent class

Create these methods:

```
work()  
salary()
```

work() should print:

```
Employee is working!
```

For **salary()**, use an if-else condition:

- If salary is ≥ 30000 → print "Good salary"
- Otherwise → print "Low salary"

2. Developer — Child class

- Override **work()** → "Developer writes code!"
- Add method **skills(int experience)**

Inside **skills()**:

- If experience ≥ 3 → "Senior-level skills"
- Otherwise → "Junior-level skills"

3. Tester — Child class

- Override **work()** → "Tester tests the application!"
- Add method **automation(boolean automationSkill)**

Inside **automation()**:

- If **automationSkill** == true → "Automation tester"
- Otherwise → "Manual tester"

4. main() class

Create a Developer object:

```
Developer d = new Developer();
```

Call:

```
work()  
salary()
```

```
skills(4)
```

Expected output:

```
Developer writes code!  
Good salary  
Senior-level skills
```

Extra Challenge

Now create a Tester object:

```
Tester t = new Tester();
```

Call:

```
work()  
salary()  
automation(true)
```

Expected:

```
Tester tests the application!  
Good salary  
Automation tester
```

This task will help you practice inheritance, overriding, adding new child-class methods, if-else logic, and object creation — all together.
